LANGUAGE: English

AB Adenosine-induced tachycardia is suggested to be mediated via A2A receptors; however, the exact mechanism for this effect remains to be understood. The present study was carried out using regadenoson, a selective A2A adenosine receptor agonist, to determine the role of the A2A receptor subtype in adenosine-induced tachycardia. Regadenoson (0.3-50 μg/kg) given as a rapid i.v. bolus to awake rats caused a dose-dependent increase in heart rate (HR). Mean arterial pressure (MAP) increased at lower doses, whereas at higher doses, there was a decrease in MAP. The increase in HR was evident at the lowest dose (0.3 μg/kg) of regadenoson at which there was no appreciable decrease in MAP. Pretreatment with 30 μg/kg ZM 241385, an A2A receptor antagonist, attenuated the decrease in MAP and the increase in HR caused by regadenoson. Pretreatment with metoprolol (1 mg/kg), a β-blocker, attenuated the increase in HR but had no effect on the hypotension caused by regadenoson. In the presence of hexamethonium (10 mg/kg), a ganglionic blocker, the tachycardia was completely prevented even though MAP was further reduced. Regadenoson treatment (10 μg/kg) significantly increased plasma norepinephrine levels almost 2-fold above baseline. The dissociation of HR and MAP effects by dose, time, and pharmacol. interventions provides evidence that tachycardia caused by regadenoson is independent of the decrease in MAP and may not entirely be baroreflex-mediated, suggesting that regadenoson may cause a direct stimulation of the sympathetic nervous system via activation of A2A adenosine receptors.

IT **313348-27-5**, Regadenoson
RL: PAC (Pharmacological activity); BIOL (Biological study)

presence of reversible hypoperfusion was 86%. The 400-μg dose was better tolerated. Overall, regadenoson was well-tolerated; side effects (e.g., chest discomfort, flushing, dyspnea) were generally mild in severity and self-limiting. High-grade atrioventricular block and bronchospasm were not observed Conclusions: Regadenoson is well-tolerated and seems as effective as adenosine for detecting and quantifying the extent of hypoperfusion observed with SPECT perfusion imaging. Phase III clin. trials are now underway, given the promise of regadenoson's reduced side effects and simplicity of bolus administration.

AB A review. Coronary vasodilators such as adenosine and dipyridamole, commonly used in pharmacol. stress testing, stimulate adenosine A2A receptors. However, both agents also nonselectively stimulate A1, A2B and A3 receptor subtypes, resulting in a high incidence of adverse events. Research efforts continue in an attempt to develop novel pharmacol. stress agents with fewer unwanted side effects, more selective A2A receptor-agonist effects and which can be administered as a bolus instead of by infusion to produce selective vasodilatation with a rapid onset and short duration of action. Regadenoson is a novel low-affinity A2A

AB A myocardial imaging method that is accomplished by administering one or more adenosine A2a adenosine receptor agonist to a human undergoing myocardial imaging as well as pharmaceutical compns. comprising at least one A2a receptor agonist, at least one liquid carrier, and at least one co-solvent. CVT-3146 is a useful pharmacol. stress agent for myocardial perfusion imaging. CVT-3146 is formulated in a liquid carrier comprising sodium chloride, sodium bicarbonate, EDTA, methylboronic acid and propylene glycol. It is administered as an i.v. bolus.

AB The present invention provides methods and compns. for preventing platelet aggregation and for treating individuals suffering from conditions or undergoing procedures that may result in unwanted platelet aggregation. In particular the invention provides methods and compns. for arterial vessel pacification. The methods are based on the administration of a therapeutically effective amount of a glycoprotein IIb/IIIa receptor antagonist, e.g., xemilofiban. The treatment may commence prior to a medical or surgical procedure or an outbreak of a condition, either of which results in the activation of platelets that may lead to thrombus formation, and may continue thereafter.

AB The structure-affinity relationships of two novel 2-substituted adenosine series containing a substituted pyrazole attached at the N-1 or C-4 position for the adenosine (ADO) A2A receptor are described. Compds. in the 2-(N-1-pyrazolyl) adenosine series provided the highest affinity for the ADO A2A receptor as compared to the 2-(C-4-pyrazolyl) series. The main structural differences between the two series point to the N-1 nitrogen imparting favorable binding interactions with the receptor.

L20 ANSWER 18 OF 18 CAPLUS COPYRIGHT 2006 ACS on STN
ACCESSION NUMBER: 2000:911269 CAPLUS
DOCUMENT NUMBER: 134:56920
TITLE: Preparation of nucleoside C-pyrazole as adenosine A2a receptor agonists for purposes of imaging the heart
INVENTOR(S): Zablocki, Jeff A.; Elzein, Elfatih O.; Palle, Venkata P.
PATENT ASSIGNEE(S): CV Therapeutics, Inc., USA
SOURCE: PCT Int. Appl., 55 pp.
CODEN: PIXXD2
DOCUMENT TYPE: Patent
LANGUAGE: English
FAMILY ACC. NUM. COUNT: 1
PATENT INFORMATION:
